

# Tree sort

A **tree sort** is a sort algorithm that builds a binary search tree from the elements to be sorted, and then traverses the tree (in-order) so that the elements come out in sorted order.<sup>[1]</sup> Its typical use is sorting elements online: after each insertion, the set of elements seen so far is available in sorted order.

Tree sort can be used as a one-time sort, but it is equivalent to quicksort as both recursively partition the elements based on a pivot, and since quicksort is in-place and has lower overhead, tree sort has few advantages over quicksort. It has better worst case complexity when a self-balancing tree is used, but even more overhead.

## Efficiency

Adding one item to a binary search tree is on average an  $O(\log n)$  process (in big O notation). Adding  $n$  items is an  $O(n \log n)$  process, making tree sorting a 'fast sort' process. Adding an item to an unbalanced binary tree requires  $O(n)$  time in the worst-case: When the tree resembles a linked list (degenerate tree). This results in a worst case of  $O(n^2)$  time for this sorting algorithm. This worst case occurs when the algorithm operates on an already sorted set, or one that is nearly sorted, reversed or nearly reversed. Expected  $O(n \log n)$  time can however be achieved by shuffling the array, but this does not help for equal items.

The worst-case behaviour can be improved by using a self-balancing binary search tree. Using such a tree, the algorithm has an  $O(n \log n)$  worst-case performance, thus being degree-optimal for a comparison sort. However, tree sort algorithms require separate memory to be allocated for the tree, as opposed to in-place algorithms such as quicksort or heapsort. On most common platforms, this means that heap memory has to be used, which is a significant performance hit when compared to quicksort and heapsort. When using a splay tree as the binary search tree, the resulting algorithm (called splaysort) has the additional property that it is an adaptive sort, meaning that its running time is faster than  $O(n \log n)$  for inputs that are nearly sorted.

Tree sort

| <b><u>Worst-case performance</u></b>      | $O(n^2)$ (unbalanced)<br>$O(n \log n)$ (balanced) |
| <b><u>Best-case performance</u></b>       | $O(n \log n)$                                     |
| <b><u>Average performance</u></b>         | $O(n \log n)$                                     |
| <b><u>Worst-case space complexity</u></b> | $\Theta(n)$                                       |
| <b><u>Optimal</u></b>                     | Yes, if balanced                                  |

## Example

The following tree sort algorithm in pseudocode accepts a collection of comparable items and outputs the items in ascending order:

```

STRUCTURE BinaryTree
  BinaryTree:LeftSubTree
  Object:Node
  BinaryTree:RightSubTree

PROCEDURE Insert(BinaryTree:searchTree, Object:item)
  IF searchTree.Node IS NULL THEN
    SET searchTree.Node TO item
  ELSE
    IF item IS LESS THAN searchTree.Node THEN
      Insert(searchTree.LeftSubTree, item)
    ELSE
      Insert(searchTree.RightSubTree, item)

PROCEDURE InOrder(BinaryTree:searchTree)
  IF searchTree.Node IS NULL THEN
    EXIT PROCEDURE
  ELSE
    InOrder(searchTree.LeftSubTree)
    EMIT searchTree.Node
    InOrder(searchTree.RightSubTree)

PROCEDURE TreeSort(Collection:items)
  BinaryTree:searchTree

  FOR EACH individualItem IN items
    Insert(searchTree, individualItem)

  InOrder(searchTree)

```

In a simple functional programming form, the algorithm (in Haskell) would look something like this:

```

data Tree a = Leaf | Node (Tree a) a (Tree a)

insert :: Ord a => a -> Tree a -> Tree a
insert x Leaf = Node Leaf x Leaf
insert x (Node t y s)
  | x <= y = Node (insert x t) y s
  | x > y  = Node t y (insert x s)

flatten :: Tree a -> [a]
flatten Leaf = []
flatten (Node t x s) = flatten t ++ [x] ++ flatten s

treesort :: Ord a => [a] -> [a]
treesort = flatten . foldr insert Leaf

```

In the above implementation, both the insertion algorithm and the retrieval algorithm have  $O(n^2)$  worst-case scenarios.
